PROJECT SYNOPSIS

StudentConnect – Student Project Collaboration Platform

Project Type	Flutter-based Student Collaboration Application
Project Module / Working Name	TaskManager
Primary Purpose	Project creation, team formation, task management, progress tracking and documentation

1. Introduction

StudentConnect is a student-oriented project collaboration platform designed to make academic project work more organized and transparent. Students commonly face difficulty in finding suitable teammates, dividing responsibilities, keeping track of pending work and maintaining project-related documentation. The proposed application brings these activities into a single platform where students can create projects, form teams, assign tasks and monitor progress.

2. Problem Statement

Academic projects are frequently managed through informal communication channels, scattered documents and personal task lists. This can lead to unclear responsibilities, missed deadlines, poor visibility of project progress and difficulty maintaining project records. Students also need a convenient way to discover teammates and coordinate their contributions. StudentConnect addresses these problems through a centralized project and task-management environment.

3. Objectives

- Provide a centralized platform for creating and managing academic projects.
- Help students form project teams and coordinate with teammates.
- Allow project members to create, assign and manage tasks.
- Provide progress tracking so that team members can understand the current project status.
- Maintain project-related documentation in an organized manner.
- Reduce dependency on scattered communication and manually maintained task lists.

4. Major Features / Modules

Module	Purpose
Project Creation	Create and maintain academic project information.
Team Formation	Support formation and coordination of project teams.
Task Management	Create, assign, update and track project tasks.
Progress Tracking	Provide visibility into task and project completion status.
Project Documentation	Keep important project information and documents organized.

5. Technology and Development Environment

The project is structured as a Flutter application. The supplied project structure contains Flutter/Dart application files along with platform folders for Android, iOS, Linux, macOS, Web and Windows. The Android module also contains a *google-services.json* file, indicating Firebase/Google-services integration on the Android side. The project includes an assets directory, a lib directory for application source code, test files and the standard Flutter package configuration through *pubspec.yaml*.

6. Scope

The platform can be used for individual or team-based academic projects, particularly where students need a structured workflow from project creation to task completion and documentation. The modular design can be extended in the future with features such as notifications, deadlines and reminders, richer team communication, role-based access, analytics, file sharing and project evaluation.

7. Expected Outcome

The expected outcome is a user-friendly collaboration system that gives students a single place to organize project work, coordinate team members, manage responsibilities and monitor progress. By making project information and task status more visible, StudentConnect aims to improve coordination, accountability and overall project-management efficiency.

8. Conclusion

StudentConnect provides a practical solution to common problems encountered during academic project collaboration. Its focus on project creation, team formation, task assignment, progress tracking and documentation makes it suitable as a centralized student project-management platform. The Flutter-based structure also provides a foundation for deployment across multiple platforms.
